

Step 1

Remove all screws on the backside of the card. Please note that there are two versions of the EVGA GTX 460, yours may differ from the one below.

Step 2

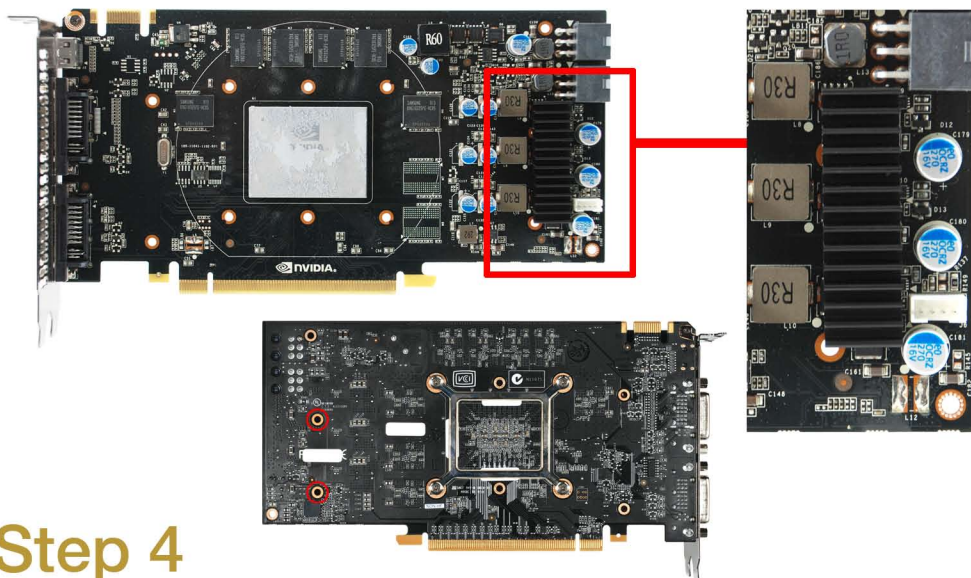

Remove the fan assembly and heatsink.

Step 3

Place the VREG cooler on your GTX 460 as indicated in the picture below. The side with the lower profile fins points towards the bottom.

*Card layout may vary depending on model. Install the included screws.

Step 4

Reinstall the fan assembly, install your card and fire up your favorite game!
